The present invention relates to a connecting assembly for connecting a mobile terminal to a telecommunication network, the assembly comprising: a mobile telephone supporting base provided with a first connection terminal, a telecommunications network adapted to receive and transmit signals via a second connection terminal, a connecting interface arranged to connect the first connection terminal to the second connection terminal, the connecting interface being mounted on the base by means of an arrangement which co-operates in a first configuration to hold the connecting interface substantially parallel to the base and in a second configuration to hold the connecting interface substantially orthogonal to the base. More precisely, the invention relates to the specific case where the connecting interface, which is provided with a first and a second connection terminal, is mounted on the base and is intended to connect a mobile telephone supporting base to a telecommunications network, in particular a mobile telephone network. To meet the increasing demand for wireless communications services in recent years, more and more mobile terminals, also known as mobile phones or handsets, are equipped with a base provided with a telecommunication interface adapted to connect the mobile terminal to a telecommunications network, in particular a mobile telephone network. In most cases, the telecommunication interface of the base is provided with at least one connection terminal adapted to connect the telecommunication interface to an external terminal adapted to connect the mobile telephone to the telecommunications network. A mobile telephone supporting base provides the user of the mobile telephone with access to the network, in particular a mobile telephone network. Mobile telephone supporting bases are therefore known by those skilled in the art as GSM support bases or GSM support systems. In general terms, the mobile telephone supporting base comprises at least one base which is

No. 4,535,417 which teaches a suction nozzle which is connected to a vacuum source and is controlled by a microprocessor. The microprocessor receives a signal for activating the nozzle from a photosensor. The U.S. Pat. No. 4,535,417 discloses the use of a microprocessor for determining the desired cleaning pattern. This method of cleaning carpets is limited in its efficiency in that it fails to determine automatically the cleaning pattern.Q: Dell XPS L502x - WiFi stopped working after Win7 64 bit install I have a Dell XPS L502x. Here are my specs: Dell XPS L502x Broadcom BCM43142 802.11b/g/n I'm assuming this is the problem, and I'm not really sure how to go about solving it. Does anyone have any idea what I can do to get my wireless working? A: To make things easier: The wifi is not the driver: it is part of the kernel. The wifi card itself is free software and should work. The driver should work and was installed, but does not work. The wifi card is installed correctly. There is no wireless device recognized or installed. It could be that there is a problem with the firmware or some other proprietary blobs. You need to install the broadcom 2d92ce491b
