The Pen Tool is an ideal tool for putting text on your images, or for designing your own. The Pen Tool can also be used for drawing shapes, for instance to give structure to a photograph or to create a border. Drawing tools allow you to build shapes in your image. They can be used to create complex and original artwork. Effects are a very powerful tool for creating special artistic effects in your images. The Zoom Tool and some of the tools discussed next allow you to magnify parts of your image with ease. Effects let you manipulate a single pixel, or groups of them at once. For example, you can create crazy looking outlines with the Wave tool. The Refine Edge tool lets you manipulate the edges of images. Because edges are sometimes a weak point in photographs, the Refine Edge tool can help you fix them. The Gradient Tool is the only one that does not need to be calibrated. It lets you create and define gradients by painting inside the Gradient Tool. The Colorize Area tool is an excellent tool for creating surreal and artistic effects on your image. Shape tools let you create shapes and draw lines on your image. You can then fill them with a color or define borders to create a complex shape. The Magic Wand tool is an ideal tool for automatically selecting areas of an image based on certain criteria. It can select almost any color or shape, and can be calibrated to perfectly fit the image you selected. The Spot Healing Brush tool allows you to "erase" your image by selecting pixels in another area to replace those you are trying to remove. One of the most common tools in Photoshop is the Pen Tool. The Pen Tool is used to draw basic shapes, lines, text, and objects that can easily be found on the screen. It is also used for designing shapes or adding structure to images. Many Photoshop users tend to be a bit over enthusiastic when it comes to launching and closing programs. However, there are some things you can do to make Photoshop a less tedious application to use. The best way to learn to use Photoshop is to look around the program. Below is a list of the most common tools and features you should have available on your toolbar. You can read the pages in the program as you are using it to understand the basics of how things work. The program will ask you to read a page, but a quick turn to the help menu will tell you where to look for instructions. The Basic Menu You can

### What's New In Adobe Photoshop CS4?

These new images show what looks like a completely natural solar storm.

---

A new study has revealed that a massive solar storm struck the earth on Sept. 11, 1859. The study examined historical documents, as well as data on the British Challenger expedition to the Sea of Japan in June 1859 and the expedition's logbooks and found that the huge solar storm had hit the Earth's magnetosphere a few hours after the expedition started. For a full explanation of the research, read the journal Nature paper here.

[Photo illustration of 1859 solar storm] The researchers' study "provides evidence that a geomagnetic substorm may occur in response to the June 1859 magnetic storm of the largest solar flare ever detected on the Sun by the extreme ultraviolet imaging spectrometer (EVI) on board the U.S. space-based Solar and Heliospheric Observatory (SOHO)," study lead researcher Greg Love, of the Johns Hopkins University Applied Physics Laboratory, wrote in a news release. The 1859 solar storm caused auroras — northern lights — to light up the night sky over the U.S., Europe and much of Asia. Observations of the solar storm show that it produced a type of "sudden-onset" geomagnetic storm on Earth, study lead researcher Cin-Ty Lee, of the University of Wisconsin-Milwaukee, explained in the news release. "Auroras are associated with the largest solar storm events, and this is the first time scientists have been able to document a sudden-onset substorm in response to the largest solar storm," Lee said in the news release. "Previous research has shown that a sudden-onset substorm is less pronounced when the magnetic storm is weaker or delayed. This suggests that this substorm may be more common during the largest events." The researchers discovered that the magnetic cloud of the 1859 storm formed in the three hours after the intense solar flare began. The space storm then passed through the Earth's magnetosphere, and it took roughly an hour for it to reach Earth's surface. Follow SPACE.com on Twitter @Spacedotcom. Venus Expedition The Venus Expedition of 1975 was a series of experiments by the Russians to learn more about the Venusian atmosphere and surface. The particular experiment was a balloon flight with a trolley filled with instrument packages.
