Using the Brush, Gradients, and Patterns If you're aware of that wonderful brush tool I discuss in Chapter 8, you probably know all about the Brush and Gradient tools. These tools enable you to edit specific areas with a brush, adjusting color, transparency, or blending modes. The Gradient tool can affect an entire color layer, an entire layer style, or just a specific point with a gradient. You can use the gradient to add or remove color, or create a soft transition between two colors. You can specify any of the commonly used blend modes — see Table 9-2 for more detail.

Roman Catholic Diocese of Pusan The Diocese of Pusan (Dioecesis Pusanensis;, Hanja: 釜山天主教區) is a Roman Rite diocese of the Latin Church of the Catholic Church in South Korea. It is a suffragan of the Archdiocese of Seoul. The cathedral of the diocese is Cathedral of Our Lady of Peace in Pusan, South Korea. History The diocese was established in 1946 as the Apostolic Prefecture of South Korea by papal bull Arcano by Pope Pius XII as South Korea was under Japanese occupation and was not a diocese. In 1945, having been split from the Archdiocese of Seoul, the Prefecture of Mokpo had split from it to become a diocese. So the diocese of South Korea needed a new metropolitan see, as many of the episcopal sees of Korea were metropolitan, or metropolitian, in the Roman Catholic Church. On December 14, 1945 Pope Pius XII established the diocese of Pusan from the Apostolic Prefecture of South Korea, which had been split from Seoul. On September 10, 1959 it was elevated to the status of diocese. On that occasion the name of the see was changed to Cathedral of Our Lady of Peace. On June 22, 1963 it was again renamed to its current name, the Diocese of Pusan. On that occasion its episcopal seat was also changed to its current name of Cathedral of Our Lady of Peace. Split tolerance in a mouse model of ovalbumin-induced arthritis. Rheumatoid arthritis is an autoimmune disease of unknown etiology. Animal models mimicking the histopathological and clinical manifestations of this condition have been difficult to establish. The purpose of this study was to develop a new animal model for rheumatoid arthritis by administering an antigen, ovalbumin, to mice pretreated with a disease-protective nondepleting anti-T cell receptor monoclonal antibody (clone GK1.5) and thus to simultaneously trigger the autoimmune disease and initiate treatment. The anti-T cell receptor antibody was administered as a single injection on the day of birth or on day 15 of age or as an adjunctive therapy to mice that had been passively sensitized with the anti-T cell receptor monoclonal antibody from birth. Mice treated in these manners showed marked suppression of ovalbumin-specific T cell proliferation and interleukin-2 secretion. They also were protected against subsequent challenge with ovalbumin. The efficacy of the anti-T cell receptor monoclonal antibody was dose- and age-related. This experimental model may prove useful in studying the pathogenesis and treatment of rheumatoid arthritis.Q: Convert string of dates to POSIXct object in R I have a data.frame which contains a column of strings with POSIXct values, such as: df[5] [1] "2017-03-06T09:23:00" "2017-03-06T09:23:00" "2017-03-06T09:23:00" [3] "2017-03-06T09:23:00" "2017-03-06T09:23:00" I would like to convert it to a data.frame which has the POSIXct values as the column name.
